

Problem to solve:

Build a model to assess whether or not a borrower will pay his loan on time by analyzing a number of factors. In this project, we are going to use a German dataset from kaggale.com:

<https://www.kaggle.com/uciml/german-credit>

Our client is a German bank. This model we intend to build would help our client to better visualize the problem, keep track of the their customers' activities, and detect bankrupt clients ahead of time so the bank can develop a proactive approach.
